

Sales Desk: Implementation Plan

A build plan for a new Sales module, mirroring how the HR Desk module — Directory, roles, Firestore collections, reporting — is already built and shipped in this app. Grounded directly against the real working file, not a guessed shape, and accounting for every sheet in it.

Status — Parts 1–2 shipped · Part 3 planning only **Scope** — Sales, Founder **Prepared** — 31 Aug 2026
Source file — Bangalore 2026 (2).xlsx, 7 sheets

Already exists — reuse

New build

Decision needed first

§ What the Real Data Actually Looks Like

The workbook was opened and read sheet-by-sheet, checking every row (not just the first few), before writing this plan.

CORRECTION, MADE BEFORE ANY CODE WAS WRITTEN

The first pass of this plan reported **Frist** as "997 companies" — that was the sheet's raw *dimensioned* row count (Excel reserves formatting past the last real row), not real data. Row-by-row, **Frist** actually holds **231 real companies** (data stops at row 233). **email campaign raw** 's real count is **231**, not 1,006 — and **Pivot Second** is **not** empty, it holds a real cached pivot. All figures below are the corrected, row-verified ones.

SHEET	REAL ROWS	WHAT IT IS
Frist	231 companies	The master cold-call list — one row per company: Name, Title/Designation, Contact Person, Address (2 lines), City/PIN/State, Tel(O), Mobile, Email. It also carries its own Call Status / Comments columns, filled in on 30 and 11 rows respectively — an earlier, coarser round of tracking (DNP , Positive) that predates Second 's fuller tracking.

SHEET	REAL ROWS	WHAT IT IS
Second	245 unique (246 rows)	The working call-tracking sheet. Only 165 of these 245 companies (67%) are also in Frist — the other 80 were sourced independently, not drawn from the master list.
Moving to sales team	231 unique	Not a third source — every one of its 231 companies is already inside Second . A working copy/subset, not new leads. One unlabeled extra column, only value seen: "U" .
summary	11 real rows	Not raw data — a hand-typed status funnel plus a free-text "Meetings Arranged" log per company.
email campaign raw	231 rows	Confirmed to be exactly Frist 's own 231 companies, Name/Title/Person/Email only. Not an independent list.
First Pivot	0 rows	Genuinely empty. Safe to ignore.
Pivot Second	20 rows	Not empty — a real cached pivot of Second 's funnel, matching it exactly (Grand Total 246). Useful as an import cross-check, not an extra source.

The real universe is **311 unique companies** — the union of **Frist** (231) and **Second** (245), overlapping on 165. Real status values in use: **Contacted (13), Did Not Pick (111), Invalid (15), Not Interested (13, two inconsistent casings), Details Shared (1), Requested Call Back (17), Meeting Arranged (6), Lost (3)**, plus 67 blank rows meaning "Yet to be Called." **Seven real reps**, not four: **Akshay, Sarath, Punit, Umashree, Shareen, Bhavya, Gaurav**.

DATA QUALITY, CARRIED OVER AS-IS

The sheet has both **"Not Interested"** and **"Not interested"** — inconsistent casing. Worth normalizing on import rather than reproducing the inconsistency in the new system.

1 Core Lead Management

A new module, mirroring HR's Directory.

01 Sales role and access

- 1 **already exists, extend** A **sales** role already exists in the codebase (**HOME_FOR_ROLE.sales** , **DEPARTMENT_ROLES**) — but only as a demo department with no real backend. This plan makes

it real: one flat role, not per-rep permissions. Reps (Akshay, Sarath, Punit, Umashree, Shareen, Bhavya, Gaurav) each get a normal login with `role: 'sales'`, the same self-registration-then-Founder-grants-the-role pattern already used for HR/IT/Coordinator.

- 2 **new build, small** `sales` is missing from Super Admin's `EDITABLE_ROLES` list — add it, or nobody can actually be granted this role from the UI.
- 3 **reuse** Reuse the existing role-gating middleware (`roleMiddleware.js`) — no new access-control mechanism needed.

02 The `sales_leads` collection

- 1 **new build** One new Firestore collection, `sales_leads` — one document per company/contact, consolidating what's currently split across the `Frist` master sheet and the `Second` tracking sheet into a single record (field mapping table below).
- 2 **decide first** Finalize the `status` enum. Recommendation, based on what's already in the sheet: `Yet to be Called` (default), `Contacted`, `Did Not Pick`, `Invalid`, `Not Interested`, `Details Shared`, `Requested Call Back`, `Meeting Arranged`, `Lost`, plus a new terminal state not yet in the sheet, `Converted`, for when a meeting actually turns into a client.
- 3 **reuse** Reuse the exact `makeCrud` factory pattern from `hrDeskController.js` (list/create/update/delete against one collection, bounded reads, `lastUpdatedBy` tracking) — no new CRUD mechanism, the same shape HR's `candidates` / `employees` already use.

Field mapping — Excel column → new record field (every sheet accounted for)

NEW FIELD	SOURCE IN THE EXCEL FILE
<code>companyName</code>	<code>Frist</code> ."NAME OF THE COMPANY"
<code>contactTitle</code> , <code>contactName</code> , <code>designation</code>	<code>Frist</code> ."Title" / "NAME OF THE PERSON" / "DESIGNATION"
<code>address1</code> , <code>address2</code> , <code>city</code> , <code>pin</code> , <code>state</code>	<code>Frist</code> .ADD1 / ADD2 / CITY / PIN / STATE
<code>phone</code> , <code>mobile</code> , <code>email</code>	<code>Frist</code> .TEL(O) / MOBILE / E-MAIL
<code>status</code>	<code>Second</code> .Status — falls back to <code>Frist</code> ."Call Status" (code-mapped: <code>DNP</code> →Did Not Pick, <code>Positive</code> →Contacted) where <code>Second</code> has no row for that company

NEW FIELD	SOURCE IN THE EXCEL FILE
<code>assignedTo</code>	<code>Second</code> ."Assigned to"
<code>comments</code>	<code>Second</code> .Comment — falls back to <code>Frist</code> .Comments where <code>Second</code> has no row
<code>lastCalledDate</code> , <code>nextCallDate</code>	<code>Second</code> ."Last called Date" / "Next call Date"
<code>meetingNotes</code>	<code>summary</code> sheet's free-text "Meetings Arranged" log, per company
<code>source</code>	fixed value on import, e.g. <code>"Bangalore 2026"</code> — keeps a future city list distinguishable
<code>importRowNo</code>	<code>Frist</code> / <code>Second</code> ."Sl. No" — traces a record back to its exact source row
<code>importFlag</code>	<code>Moving to sales team</code> 's unlabeled last column, kept as-is — meaning undocumented, flagged for the sales team to clarify
<code>created_at</code> / <code>updated_at</code> / <code>lastUpdatedBy</code>	same audit-field convention already used on <code>candidates</code>

03 Bulk import from the existing Excel file

- 1 **new build** An "Import Leads" action (HR/Founder- and Sales-manager-facing), reusing the file-upload pattern already built for Employee Document uploads (`multer` on the backend). The uploaded `.xlsx` is parsed server-side and mapped into `sales_leads` docs.
- 2 **new build, small** Import logic dedupes on normalized `companyName` (+ `mobile` as a tiebreaker): a row that already exists gets its `status` / `assignedTo` / `comments` / call dates updated rather than creating a duplicate. This matters because `Frist` (231) and `Second` (245) only overlap on 165 companies — the other 80 in `Second` are genuinely new, not the same list at an earlier stage.
- 3 **decide first** Whether the first import run should be exactly this file, done once by hand from the new screen, or scripted separately. For one ~1,000-row file, doing it once through the built UI is simpler and doubles as the first real test of the import feature.

04 Sales Directory screen

- 1 **new build** `pages/sales/Directory.jsx` — same shape as HR's Directory: a searchable/filterable list (company, contact, city, status, assigned rep) plus a Lead Profile

popup on click, matching the popup already redesigned for HR (view mode with all details, an Edit pencil that flips the same card into inline-editable fields, Save/Cancel).

- reuse** Reuse `SalesDeskContext` (new context, copying `HRDeskContext` 's exact shape: one shared fetch on mount, role-gated the same way) instead of each screen fetching its own copy.
- new build** "Assign to" dropdown sourced from real `sales` -role users (reuse the Founder's existing user-list endpoint, filtered to `role === 'sales'`) instead of a hardcoded rep list.

2 Pipeline, Meetings & Reporting

05 Meeting tracking

- decide first** Whether a meeting is a couple of fields directly on the lead (`meetingDate` , `meetingNotes` — enough for the current one-meeting-then-converts-or-not flow visible in the `summary` log) or a separate `sales_meetings` collection, needed only if one company gets several tracked meetings over time. The real data today shows simple one-line notes per company, which fits the simpler on-lead fields.
- new build** Once decided, a "Log Meeting" action on the Lead Profile that sets `status: 'Meeting Arranged'` and records the date/notes — the same interaction shape as HR's inline Leave/Performance "Save" pattern already built.

06 Summary dashboard

- new build** A status-funnel card set (Yet to be Called / Contacted / Meeting Arranged / etc.) — exactly what the `summary` sheet's hand-typed table already does manually; this makes it live instead of a snapshot someone recounts by hand.
- new build** A per-rep leaderboard (leads contacted, meetings arranged, this month) — straightforward once `assignedTo` and `status` live on real records instead of a spreadsheet column.
- reuse** Reuse `recharts` (already a dependency, already used in Founder's reporting views) for the funnel/leaderboard charts.

07 Email campaign export

- 1 **new build** A filtered CSV export button (Name, Title, Contact, Email — the exact shape of the `email_campaign_raw` sheet), reusing the CSV-export pattern already built for Super Admin Analytics (`exportAnalyticsCsv` , blob response) rather than inventing a new export mechanism.

08 Founder oversight

- 1 **new build, small** A "Sales" rollup card on the Founder Dashboard (leads contacted this month, meetings arranged, active reps) — the same visual pattern as the existing HR Portal rollup grid already on that dashboard.

3 The Full CRM Sidebar

Parts 1–2 above are shipped. The user then pointed at a reference CRM (screenshots: sidebar, Dashboard, Priority-leads/Team-activity/Today's-schedule) and asked for the same sidebar structure and Dashboard depth, in our theme, on our data. Read with 10+ years of sales-ops eyes, not just an engineering one — a few things in that reference are basic CRM fundamentals our schema doesn't have yet. Those come first.

09 Schema gaps a sales manager would flag first

- 1 **decide first** **Deal value.** "Revenue closed ₹11.4L", every pipeline stage's ₹ figure — impossible without a rupee value per lead. New field: `dealValue` (number), HR-editable like `leaveTaken` , blank until a deal firms up.
- 2 **decide first** **Lead temperature, separate from call status.** "Hot/Warm/Cold" is a priority judgment ("how likely to close"), not the same axis as `status` ("where in the call cycle"). A lead can be freshly Contacted and still Hot. New field: `priority` (Hot/Warm/Cold, default Warm).
- 3 **new, small** **Source, as a real per-lead field.** Currently hardcoded to `"Bangalore 2026"` on import. Make it editable per-lead (Referral, Existing Client, Outbound, Campaign, Email as suggested values, datalist not hard enum) — this is what actually tells a manager which channel produces quality pipeline.
- 4 **new, small** **A place to set the monthly target.** New `sales_settings` doc (same shape as Super Admin's `system_config`): `monthlyRevenueTarget` , `dailyCallTargetPerRep` . Editable from Settings (§18).

- 5 **new build** A real notion of "a call happened." Inferring calls-today from `updated_at` is fragile (a bulk edit inflates it). Append a `callLog` entry — `{at, by, outcome}` — inside each lead's own doc on every "Log Call" action. An array field, not a new collection; no lead accumulates enough calls to hit Firestore's doc-size limits.

10 Dashboard (redesign of the shipped Overview)

- 1 **new build** Top stat row: Calls Today (from today's `callLog` entries), New Leads, Meetings, Revenue Closed (`sum(dealValue)` where Converted this month) — each against its target from `sales_settings` .
- 2 **new build** Follow-ups banner — "N need attention, X overdue, Y due today" — live from `nextCallDate <= today` , linking to §13.
- 3 **reuse, restyle** Pipeline stage bars — already built; add each stage's `sum(dealValue)` and conversion-from-previous-stage %.
- 4 **new build** Monthly target donut — `sum(dealValue)` Converted this month against `monthlyRevenueTarget` , plus a run-rate forecast.
- 5 **new build** Priority Leads table — `priority === 'Hot'` , sorted by soonest next activity, reusing the existing Lead Profile popup on click.
- 6 **new build** Team Activity — per rep, today's `callLog` count vs `dailyCallTargetPerRep` as a progress bar.
- 7 **new build** Today's Schedule — merged feed of calls + meetings due today, sorted by time.

11 Leads (extend the shipped Directory, don't rebuild)

- 1 **new, small** Add `dealValue` , `priority` , editable `source` to the existing edit form and card badges — Directory's search/filter/edit-toggle stay exactly as shipped.
- 2 **new, small** A `priority` filter pill row — "show me all Hot leads" in one click.

12 Daily Calls

- 1 **new build** A rep-facing worklist: `nextCallDate === today` or never-called, ordered by priority then longest-waiting.

- 2 **new build** One-click "Log Call" inline (outcome, comment, next date) — the single highest-leverage screen for a cold-calling operation; full profile stays one click away, not the default.
- 3 **reuse** Writes through the same `PATCH /leads/:id` Directory already uses — no new backend resource.

13 Follow-ups

- 1 **new build** Overdue (`nextCallDate < today`) and Due Today sections, sorted soonest-first, Hot-priority first within each.
- 2 **new, small** The sidebar's own live badge count — computed once in `SalesDeskContext` from the already-loaded list, no extra request.

14 Meetings

- 1 **new build** Leads with `meetingDate` set, tabbed Upcoming / Past-without-outcome (a nudge — an unresolved past meeting is a lead going quietly cold).
- 2 **new, small** "Log Outcome" action after a meeting — same update path as everywhere else.

15 Pipeline (kanban board)

- 1 **decide first** The reference's 5 columns are coarser than our 10-value `status` . Recommendation: don't add a second stored field — derive a `stage` grouping from `status` in the frontend, keeping one source of truth.
- 2 **new build** A column-per-stage board, click-to-advance moves the lead's `status` — writes through the same update endpoint.

16 Campaigns

- 1 **new build** A small `sales_campaigns` collection (name, sourceTag, targetCity, sentDate). Not a mass-mailer — that's a materially bigger, separate build. This tracks campaigns as records; the shipped CSV export is the actual send mechanism, same honest boundary this codebase already drew around the Zoho payslip tool elsewhere.
- 2 **new, small** Response rate per campaign, computed client-side from the already-loaded lead list — no new backend aggregation.

17 Reports

- reuse, extend** Everything Overview computes, plus a conversion-over-time line chart (reuse `LineChartCard`) bucketed from `callLog` timestamps, and a win/loss breakdown once Lost leads carry a reason (**decide first** : reuse the enum-not-freetext `rejectionReason` pattern already established for HR's Candidates).
- new, small** A date-range picker, reusing Super Admin Analytics' own pattern.

18 Settings

- new build** Edit `sales_settings` ' two numbers — same "one settings doc, HR/Founder-editable" shape as Super Admin's System Settings, scoped to sales/founder.
- reuse** A read-only rep roster (users where role='sales') — granting/revoking the role stays on Super Admin's Users page, not duplicated here.

§ System Architecture

How this plugs into what's already running — nothing here is invented from scratch; every client screen, backend pattern, and data-access rule already exists for HR/Candidates and is being reused, not rebuilt, for Sales.

Solid connection = real data flow (once built), the same request/response shape already proven by HR's `/api/hr-desk` routes. Dotted = a read used only for display context, not a new ownership relationship.

§ Migration Note — Every Sheet, Accounted For

`Second` is not a strict subset of `Frist`, so import has to build a true union, not just overlay one onto the other.

- Start from `Frist`'s 231 companies — every one becomes one `sales_leads` doc, including the ~30 that already have a `Call Status / Comments` value on this sheet itself. Those 30 get their old short codes mapped into the new enum (`DNP` → `Did Not Pick`, `Positive` → `Contacted`) rather than imported as literal unrecognized values.
- Match each of `Second`'s 245 companies against that set by normalized name. **165 (67%) match** — `Second`'s status/assignment/comments/dates overwrite `Frist`'s coarser status on the same record. **The other 80 don't match anything in `Frist`** — they become new leads sourced only from `Second` (company, promoter name, mobile, status, assignment — no full address/email, since `Second` never carried that).
- `Moving to sales team` needs no separate handling — all 231 of its companies are already inside `Second`. Its unlabeled column imports into `importFlag` on the matching lead rather than being dropped.
- End state: **311 total leads** — ~151 `Frist` -only at "Yet to be Called," 165 with both master-list detail and real tracking history, 80 tracking-only with thinner contact detail.
- `Pivot Second`'s cached funnel (Grand Total 246) is a good post-import sanity check — it reconciles against `Second`'s own 246 rows, not against `Frist`'s or the union's totals.
- `summary`'s hand-typed funnel counts and meeting-notes log aren't imported as data — they're exactly what the new Summary dashboard and Lead Profile's `meetingNotes` field replace going forward. The specific notes already logged there (Aisshwarya Group, Ajmera, Anika Developers, Concorde, ...) get copied into the matching lead's `meetingNotes` field by hand during import.
- `email campaign raw` needs no import path at all — confirmed to be exactly `Frist`'s 231 companies. Once `sales_leads` exists, the email-campaign export reproduces it live from real data.

Grounded against the real Bangalore 2026 (2).xlsx file and the current codebase on 31 Aug 2026. No code was written or changed in producing this plan.
