

Marketing Master Sheet → Sales Filters

Implementation plan for pulling the real customer-list data (India + Australia, ~2,800+ contacts across 5 tabs) into the Sales Desk's Directory, with filters that match how the sheet is actually worked.

Source file: MARKETING MASTER SHEET – CUSTOMER LIST 25-26	Scope: Sales Portal only	Status: Not started – code not yet written
--	---------------------------------	---

Schema	Extends the existing sales_leads Firestore collection — no new collection, just new fields on the same doc Directory/Pipeline/Reports already read.
Import	Extends the existing Excel importer in Settings → salesDeskController.js, the same one that already dedupes and protects manually-entered dealValue/priority/callLog.
UI	Filter bar lives in Directory.jsx (the master list). Pipeline and Reports get read-only versions of the same filters for consistency.

01 Schema additions to sales_leads

New fields, added alongside the existing ones (companyName, status, priority, assignedTo, etc.)

FIELD	VALUES	SOURCE COLUMN IN SHEET
country	India / Australia	inferred from which sheet tab the row came from
designationLevel	Decision Maker / Influencer / Other	derived from Designation text via a keyword map
emailVerified	Valid / Unknown / Invalid	Email Status?
phoneVerified	Correct / Unknown / Wrong	Is no. correct?
emailCampaignStatus	Not Sent / Sent / Both Done / Got Response / Bounced	Email Camp
whatsappCampaignStatus	Not Started / Going On / Done / No Response	Whatsapp Camp
linkedinCampaignStatus	Not Started / 1st Msg Sent / Follow-up Done	Linkedin Camp
linkedinConnectionStatus	Not Sent / Sent / Accepted / Already Connected	Linkedin Connection
leftOrganisation	boolean	detected from "What to do:" text
nextAction	free text	Action to be taken / What to do:
lastContactedDate	date	Last Contacted

Data quality note: city stays the existing field, but the importer normalizes casing/typos (Bangalore/bangalore, Hyderabad/Hydarebad, Ahmedabad/Amedhabad → one canonical value each) before writing, so the filter dropdown doesn't fragment into near-duplicates.

02 Import pipeline

- 1 Add a per-tab column-mapping table — the 5 tabs use different header layouts, so one fixed column order won't cover all of them.
- 2 Reuse the existing dedupe-by-email/phone logic already built for Sales import.
- 3 Run the city-normalization lookup at import time — a fixed table maintained in code, extended as new typos show up.
- 4 Keep the existing rule: re-importing never overwrites dealValue, priority, or callLog that a rep already entered manually.

03 Directory.jsx filter bar

Grouped the way a rep actually scans them, left to right

- **Country** — toggle: India / Australia (top-level, changes which City list shows)
- **City** — searchable multi-select, canonical list only, post-normalization
- **Stage / Status** and **Priority** — already exist, unchanged
- **Designation Level** — Decision Maker / Influencer / Other
- **Campaign Status** — 3 independent dropdowns (Email / WhatsApp / LinkedIn) — a lead can be mid-way on one channel and untouched on another
- **Data Quality** toggle — "Hide bad contacts" collapses wrong-email / wrong-number / left-organisation leads out of the default view (never deleted, still reachable via checkbox)
- **Assigned Rep** — already exists, maps to "marketing Head"
- **Last Contacted** — date range picker

04 Reports.jsx additions

- Leads by City (bar chart)
- Leads by campaign-channel status — a funnel per channel, showing where each one actually stalls (sent-but-no-response, bounced, etc.)
- India vs Australia split

05 QA

- 1 Import the real file end-to-end into a test/staging state first — confirm row counts per tab land correctly.

- 2 Spot-check the city-normalization map against the actual data before trusting the City filter.
 - 3 Confirm all filters combine with AND logic and stay responsive at ~2,800+ leads (Directory already paginates, so this should hold, but worth confirming post-import).
-

Scope: Directory and Reports only. Pipeline, Daily Calls, Follow-Ups, and Meetings are workflow views, not the master filter list, so they're untouched unless the filters are explicitly wanted there too.
